WASHBOARD ROADS

Just about any road with a loose surface — sand or gravel or snow — develops ripples that make driving a very shaky experience. Granular surfaces tend to develop lateral ripples under the action of surface forces exerted by rolling wheels, an effect known as washboard or corrugated road. Above a critical speed, the ripple pattern appears as small patches of traveling waves which eventually spread to the entire surface. The ripples drift slowly in the driving direction.

A team of physicists from Canada, France and the United Kingdom have recreated this "washboard" phenomenon in the lab with surprising results. (Google perso.ens-lyon.fr/nicolas.taberlet/washboard/ as well as <http://physicsworld.com/cws/article/news/30885> and www.wired.com/2011/07/the-physics-of-washboard-roads and www.sciencedaily.com/releases/2009/07/090707131834.htm)

The speed of the wheel appears to be crucial. There exists a critical velocity below which the road always remains flat and above which corrugations/ripples appear. Typically, for a car this critical velocity is around 8 km/h.

Travelling at this speed is just not feasible. However, the message coming out of these experiments is that **the slower we drive on unpaved/gravel roads, the longer it will take for the corrugations/ripples to appear.**

THE MOST SOUTHERN TIP DEVELOPMENT

The tender process for the Most Southern Tip development, which includes the construction of the Iconic Structure and the upgrade of 1.2km gravel road from the Lighthouse precinct to the most southern point, commenced with the tender clarification meetings held on 6 July 2016. The closing date for tender submissions was at the end of July 2016.

LENTE IS HIER

Soos die somer nader kom, sien mens al hoe meer klein diertjies op ons paaie. Wees waaksaam vir veral die klein skilpaadjies, slange en ander.

GENERAL

- Please take note that the SIV/SRA Facebook webpage ([Suidpunt Residents Association](#)) is up and running and being administered by Riana Fourie and Cornelia Van Rooyen.
